

K B 1 6 B - 0 2

Thank you for using DOIO products. The following tutorial will guide you on how to perform advanced settings on your keyboard. The documents required for the tutorial can be downloaded from the official [DOIO website](#). VIA is a powerful and professional keyboard customization program. Any custom modifications you make to your keyboard settings will be saved in the keyboard's hardware storage. When connected to other computers, the custom key values can be used directly without the need for additional configuration.

- MO + ↑ : Change the color of the lighting+
- MO + ↓ : Change the color of the lighting-
- MO + ← : Increase lighting brightness
- MO + → : Decrease lighting brightness
- MO +) 0 : Change the model of the lighting

VIA program

The VIA program can implement more advanced modification applications for the keyboard in addition to the initial key position function, such as modifying the key value of a certain key, setting key combinations, shortcuts, macro command programming, etc. The VIA program can be downloaded on its own from the official website and sales page.

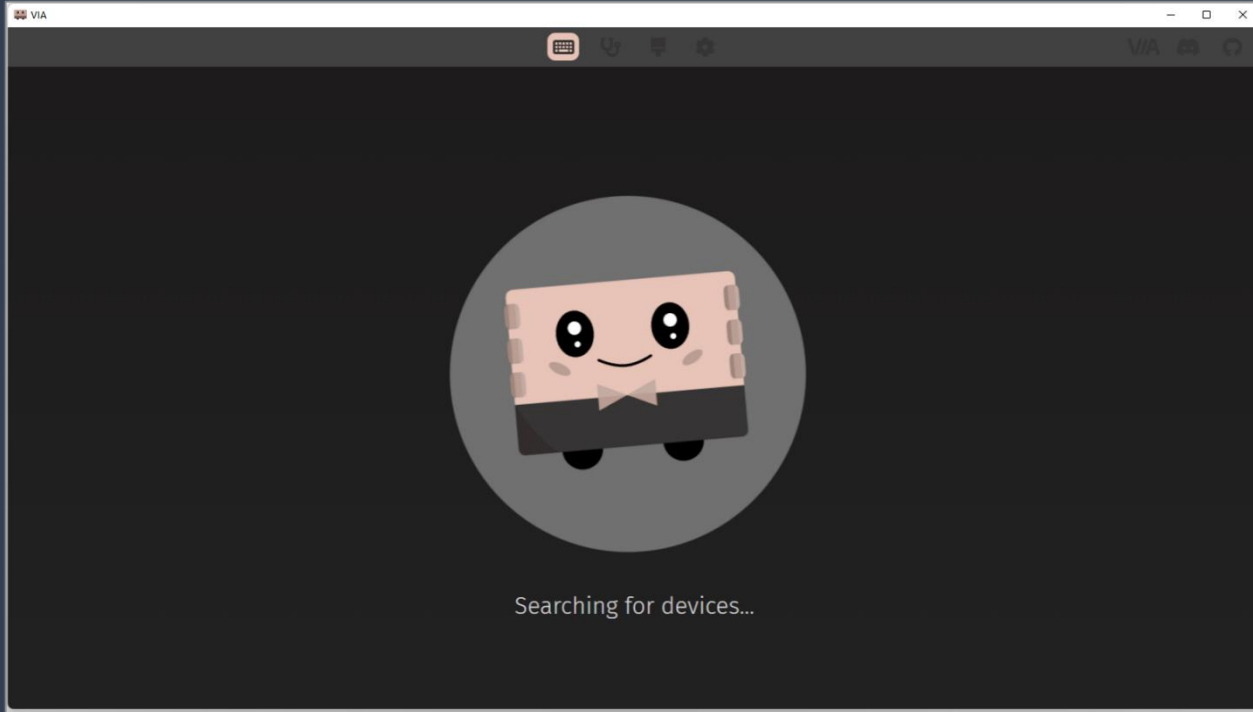

The VIA program can be accessed in two ways:

1. Enter <https://usevia.app/> or click on the [web version](#) to use the online VIA settings page in the browser
2. Download the VIA program suitable for your operating system

Download the VIA program for the Windows system: [VIA-3.0.0](#)

Download the VIA program for MAC systems: [VIA-3.0.0](#)

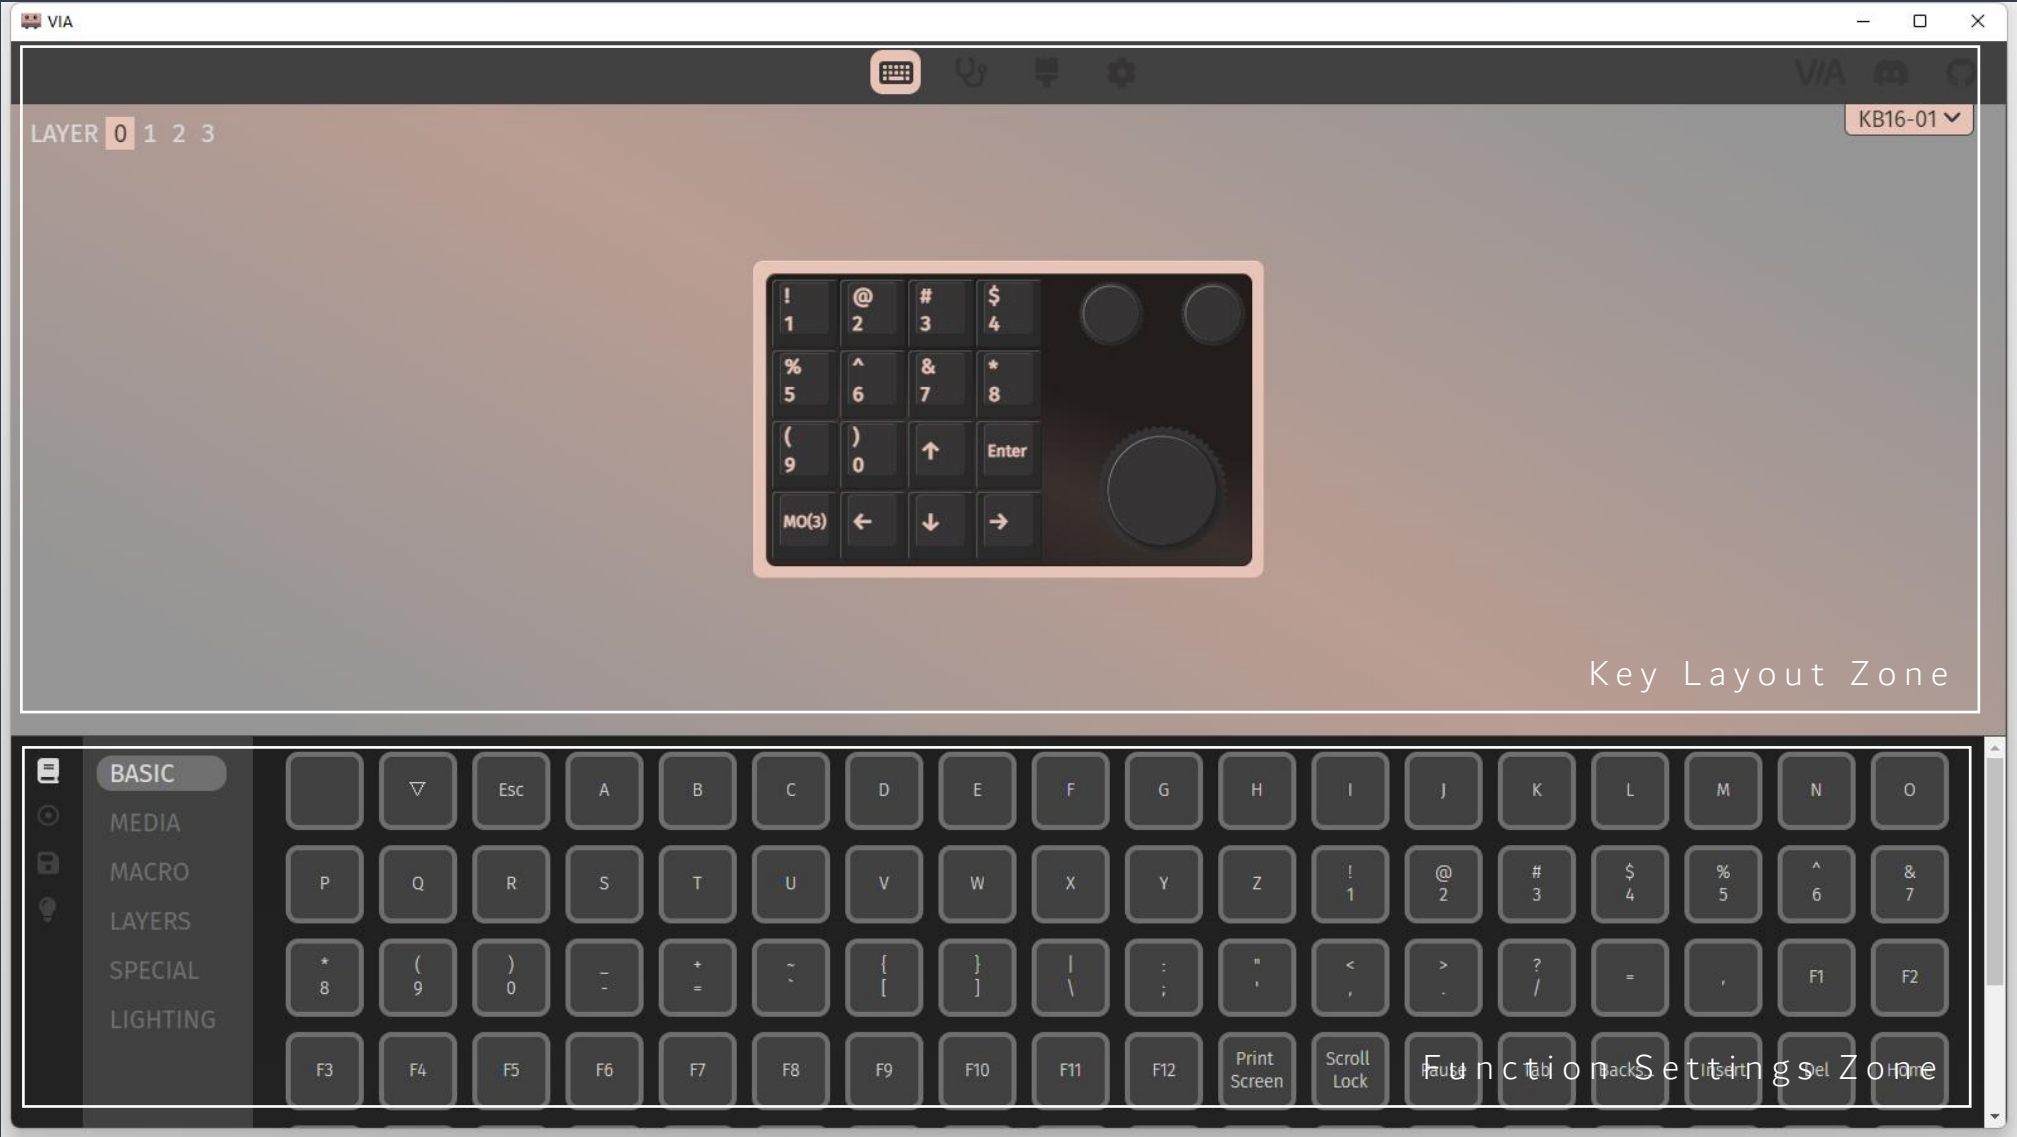

Open the VIA program

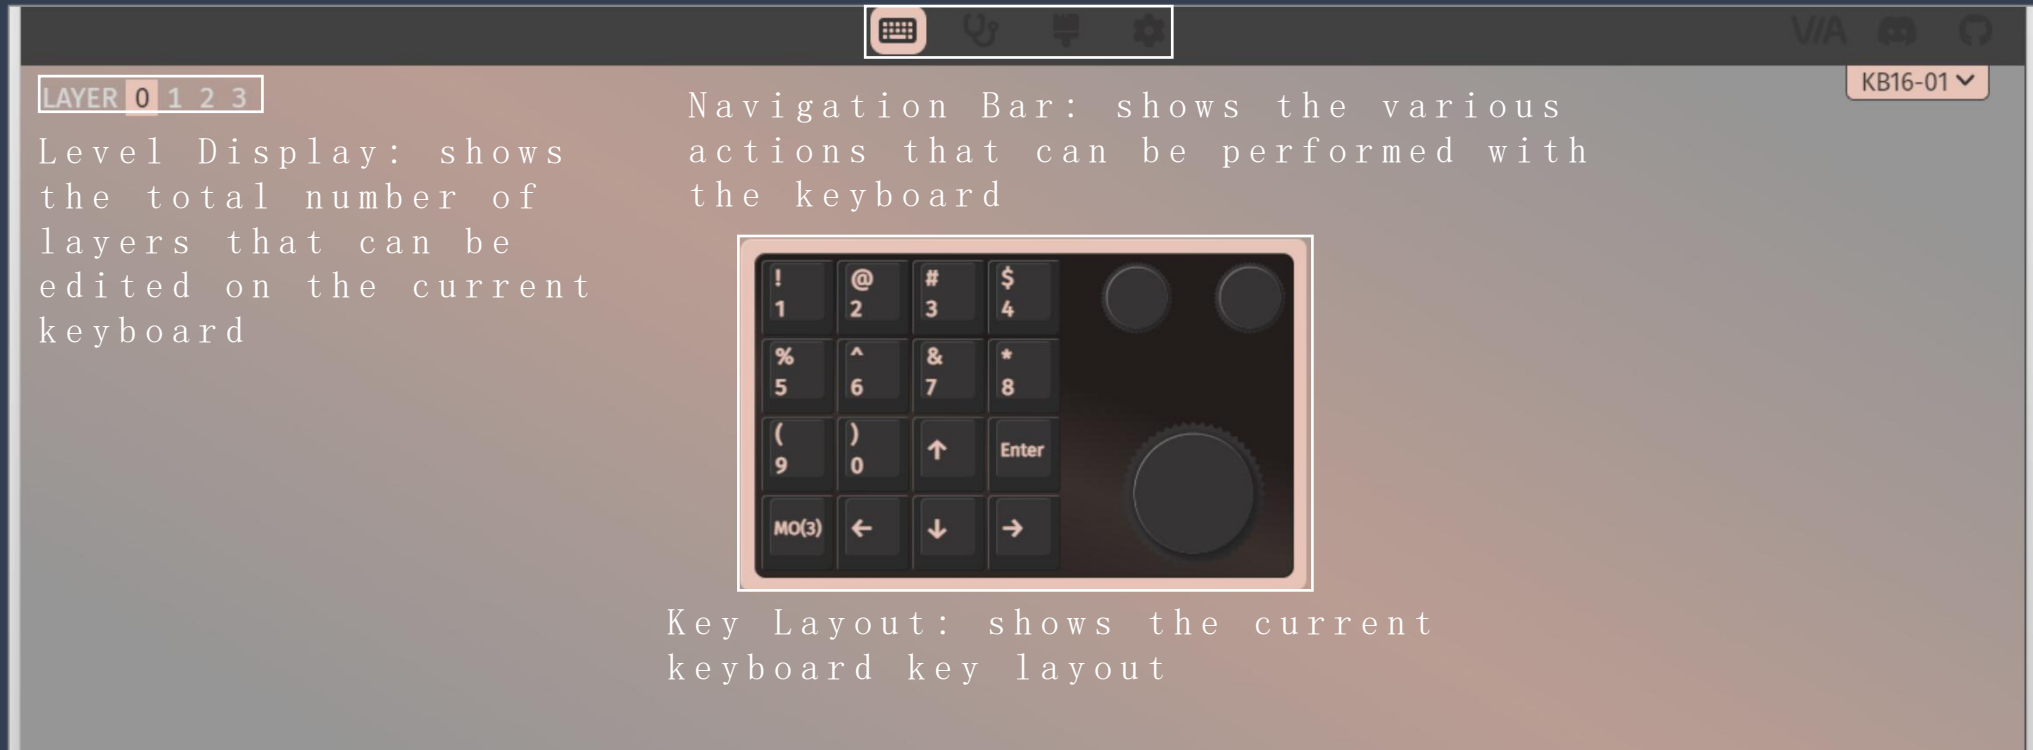

1. Web Interface: Open the VIA interface by clicking on the [web version](https://usevia.app/) or visiting <https://usevia.app/>. Once in the main interface, click on the **Authorize device +** key. In the pop-up window, select the connected keyboard and click "OK". The interface will then display the key layout diagram for the current keyboard. If the homepage is still displayed, please check if the USB cable of the keyboard is properly connected. After confirming that the USB cable is connected correctly, repeat the above steps.

2. Client End: Locate the downloaded VIA program compressed file and extract it. After extraction, click on the  to launch the program. If the program starts successfully, the interface will display the key layout diagram for the current keyboard, indicating a successful connection. If the homepage is still displayed, please check if the USB cable of the keyboard is properly connected. After confirming that the USB cable is connected correctly, reopen the VIA software.

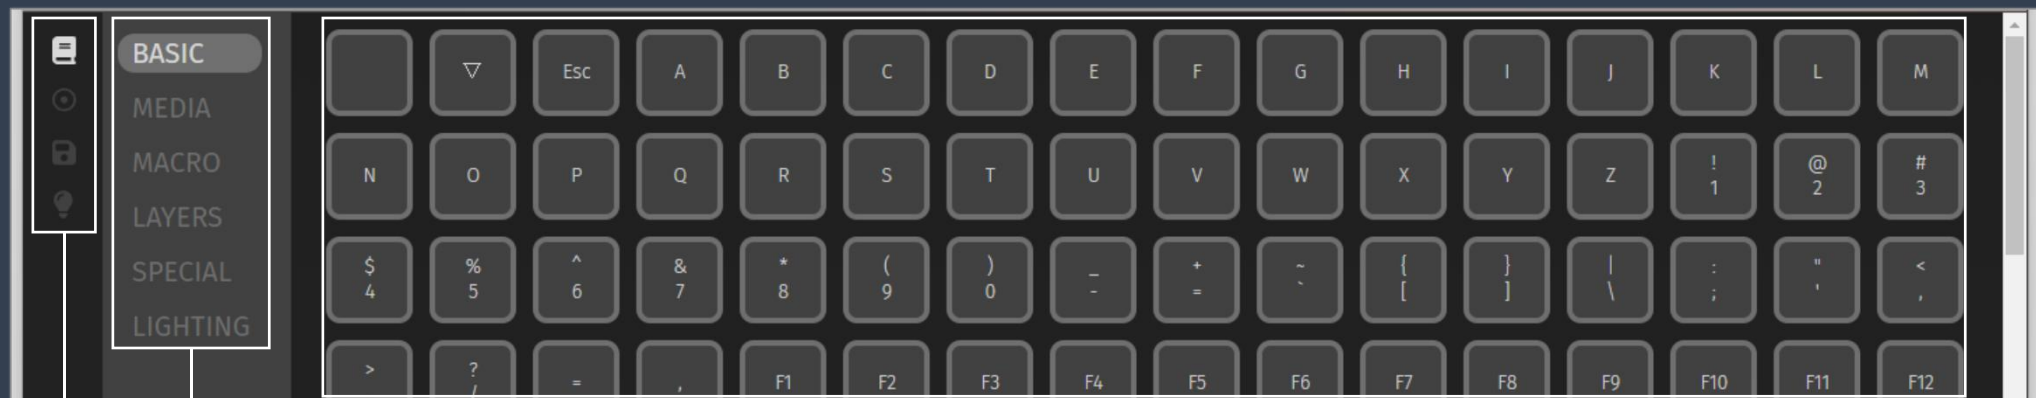

Program Interface Description

VIAProgram Interface Description--Key Layout Zone

VIAProgram Interface Description--Function Settings Zone

Functional Zone :

- KEYMAP:** change keyboard key values
- MACROS:** edit macro commands
- SAVE+LOAD:** An operation that saves and loads the current key-value layout
- LIGHTING:** actions to adjust lighting modes, light colors, etc.

Key Value Types:

- BASIC:** Basic Key Value Type
- MEDIA:** Multimedia key Type
- MACRO:** Macro Command Key Value Type
- LAYERS:** Hierarchical Change of Key Value Types
- SPECIAL:** Special Key Value Type
- LIGHTING:** Light Key Value Type

Key Values::

Show the current key values under this zone . You can change the keyboard key values by selecting the key values in this zone .

Basic Key Changes

Figure 1

Figure 2

Through VIA, we can modify the key values of each key on the keyboard, including basic single-key values, multimedia key values, layer key value modifications, lighting function key value modifications, combination key value settings, macro commands, and ANY key settings

Let's start with the easiest example.

Let's try changing key 1 on the keyboard to A,

First, click the 1 key value in the key layout zone above (Figure 1). In the function settings zone below, click to select the key value category on the left. We find A in the corresponding category and click (Figure 2). At this point, we will see that 1 in the key layout has programmed A (Figure 3). At this point, there is no need to click Save key; the key value takes effect immediately.

For other keys, if they are also changed to single-key values, just repeat the above steps.

Figure 3

How to use Layer

LAYERS: Indicate the number of key values that can be set with the same key on the keyboard, and one can use the following shortcuts to change the current key to the target key value

There are various command methods that can be used for the slice function key values, the most common being MO and TO

MO(*): When this key is pressed, the current keyboard key value is temporarily switched to the corresponding layer's keyboard key value, and by pressing the corresponding layer key at the same time, the corresponding layer key value function input can be realized. Release the MO (*) key to return to the original layer.

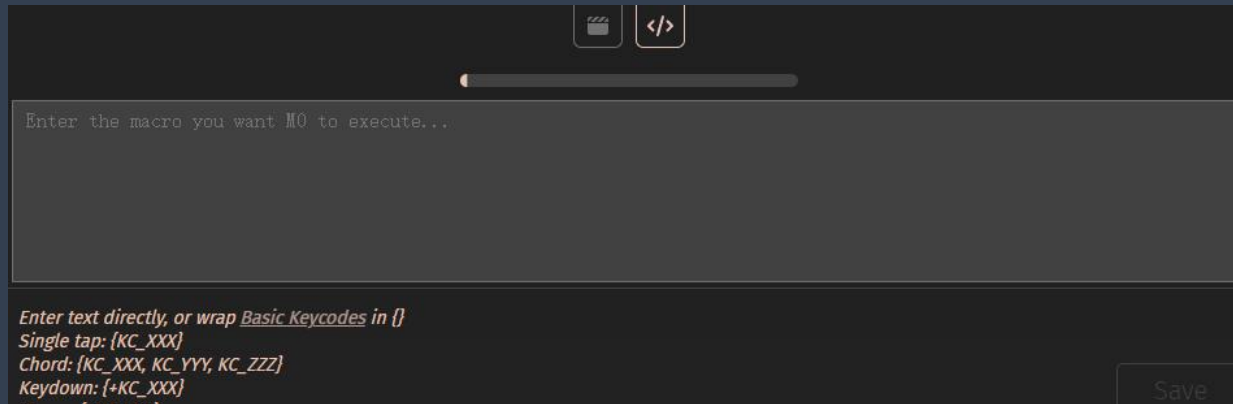

TO(*): This key is a layer switch key, and you can switch to the target layer keyboard key value by pressing it.

TG(*): This key is a layer switch key. If you press it, you can switch the current keyboard key value to the target layer's keyboard key value, and press it again to return to the original keyboard key value.

TT(*): 1、Press to temporarily switch the current keyboard key value to the corresponding layer's keyboard key value, and press the corresponding layer key at the same time to enter the corresponding layer's key value function. 2. Click 5 times in a row to switch the current keyboard key value to the target layer key value.

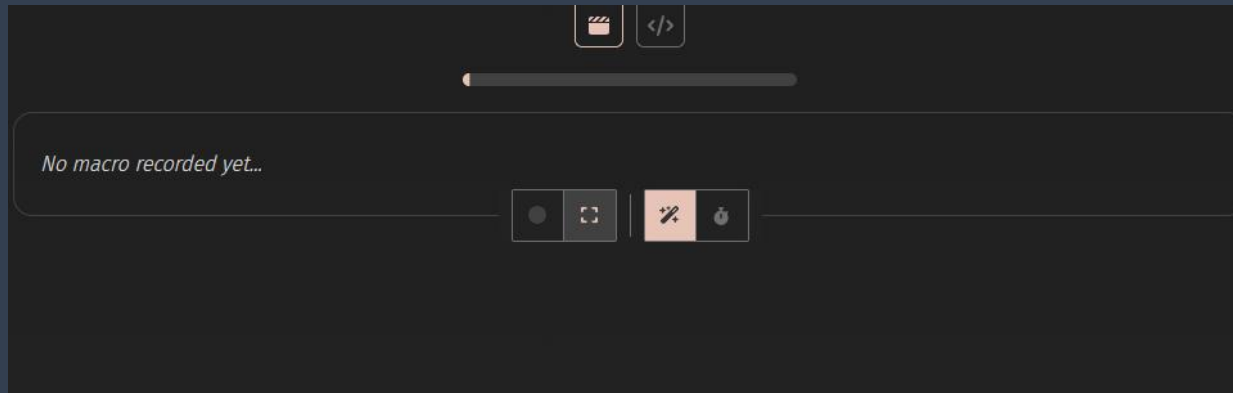

OSL(*): When this key is pressed, the keyboard key value will be switched to the target layer key value. After clicking on a key in the target layer, the original keyboard key value will be restored.

How to use macros

Input macros:

Typing each key code manually has the advantage of being able to edit keys not on the keyboard in macro commands.

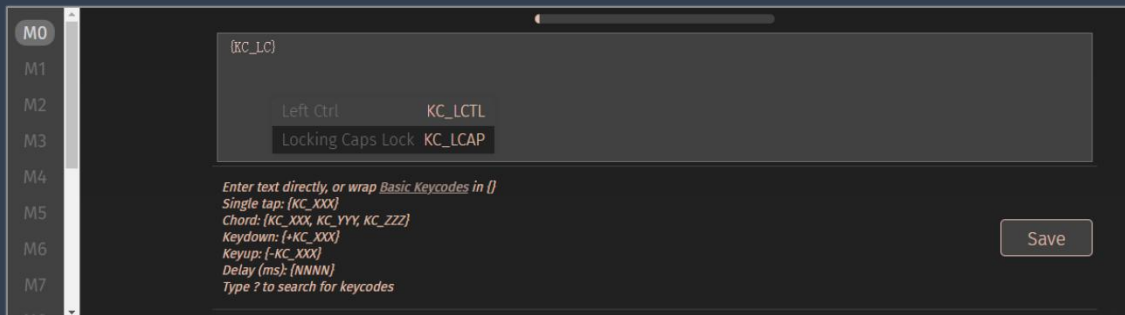

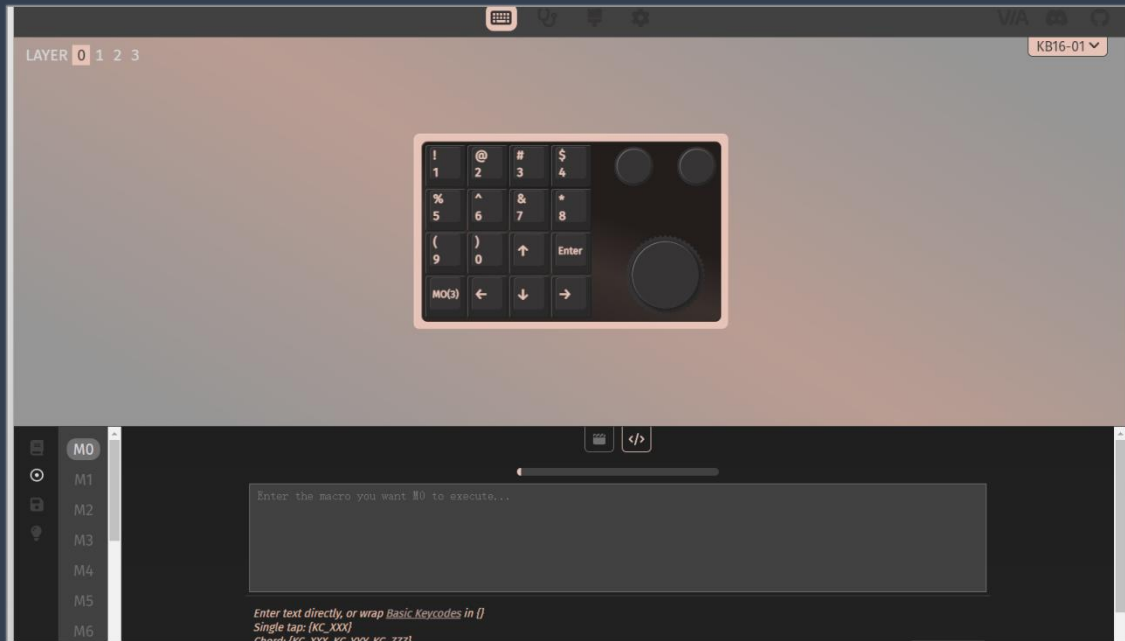

Record macros:

Instructions are entered by recording the actual clicks and lifting of the keyboard keys. The advantage is that you do not need to type in a code; you only need to press the corresponding keys on the keyboard.

Note: The macro function cannot support some simulated mouse operations. If you need to simulate mouse operation, please check the details of the ANY function section in the manual

How to use macros--Input macros

Start with a left brace. After entering the parentheses, there are drop-down options for optional key values. You can enter various key values according to the “KC_*” format. Enter individual key values one by one, and end with a right brace after entering.

The one separated by a comma in the middle indicates simultaneous triggering
Examples are as follows (Take Windows VIA for example):

Ctrl+Alt+Del: {KC_LCTL, KC_LALT, KC_DEL}

Type macro command keys in “{}”, each key starts with “KC_”, and each key is separated by “,”; pressing the corresponding macro command means that the keyboard triggers editing key values in “{}” at the same time.

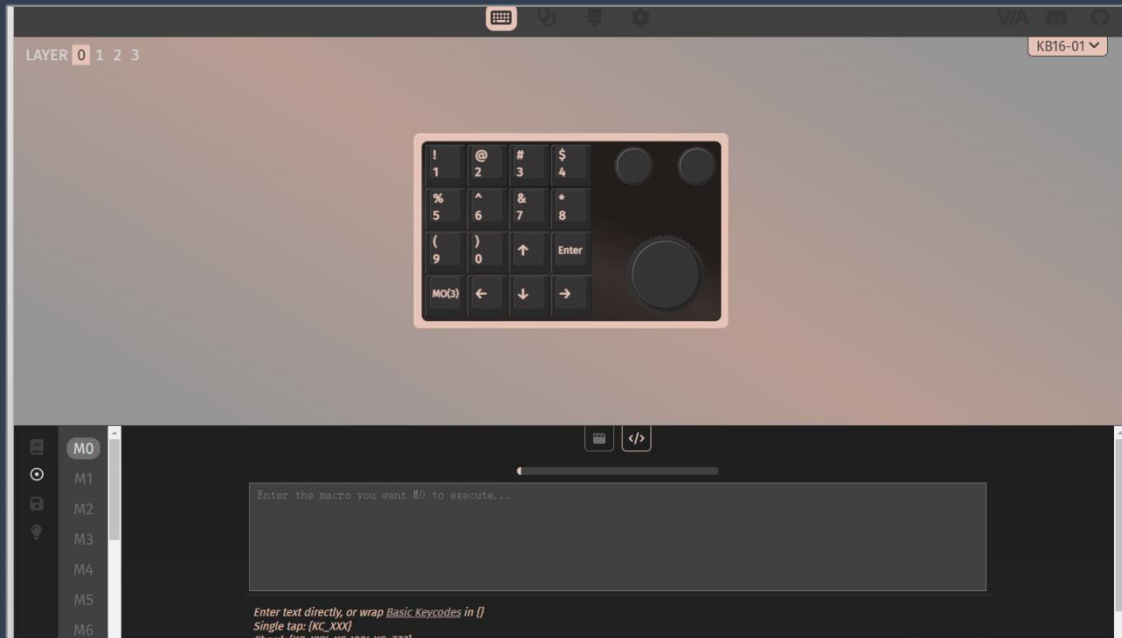

Those without commas indicate sequential input
For example: sequential input “ABC123ENTER”

{KC_A} {KC_B} {KC_C} {KC_1} {KC_2} {KC_3} {KC_ENT}

A key value is written in one “{}”, and it stands for that one key value is pressed once. And multiple “{}” key values are edited in one macro command, which stands for that the macro command presses the corresponding keys in sequence.

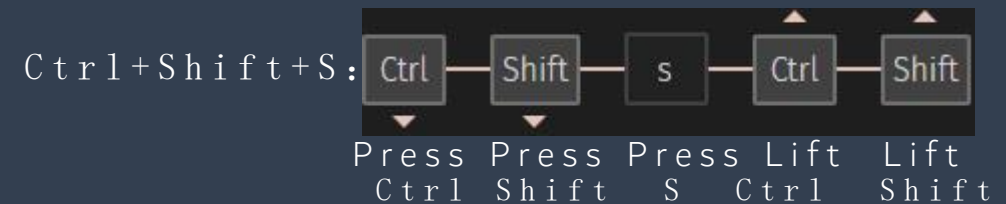

Note: The macro function cannot support some simulated mouse operations. If you need to simulate mouse operation, please check the details of the ANY function section in the manual

How to use macros--Record macros

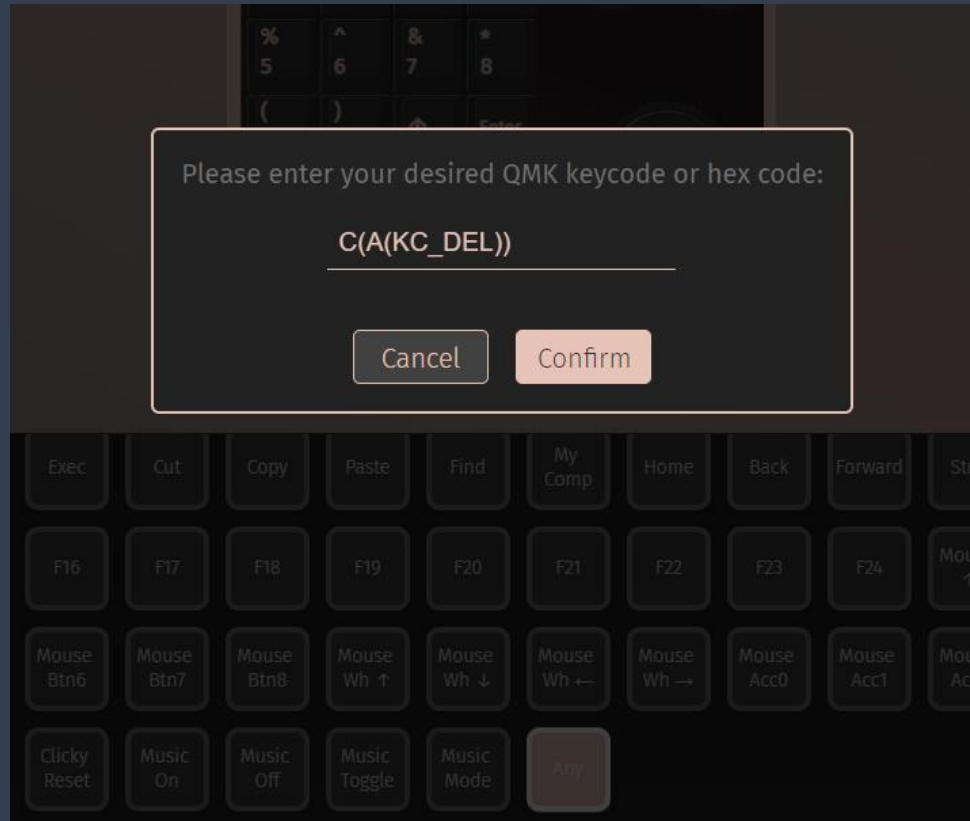

The operation of recording macros is more convenient. Click the full screen key on the macro recording interface. After the interface is full screen, click the “RECORD KEYSTROCKS” key to start recording the macro, and record the complete macro by pressing a combination of keys in the input box.

Examples are as follows (Take Windows VIA for example):

Note: The macro function cannot support some simulated mouse operations. If you need to simulate mouse operation, please check the details of the ANY function section in the manual

How to use ANY

Note:

The ANY key can define the key value of only multiple function keys and one letter (number) key

For example, CTRL+ALT+A The values of function keys and multiple letters (digits) cannot be set, for example, ALT+A+O

The ANY key can edit custom key combinations. You can apply key values to the keys and knobs. First click the key you want to modify, then click the **SPECIAL** key value type in the function settings zone below, and select the key value list on the right scroll down to the bottom, click the **Any** key, and enter the corresponding ANY key value in the input box that pops up; the followthe ANY key:

Examples (Take Windows VIA for example):

How to write Ctrl+Alt+Del: `C(A(KC_DEL))`

“C” stands for “Ctrl” in this command

“A”stands for“ALT”;

“KC_DEL”stands for“Delete”key

Under the Apple MAC system, the keyboard key values correspond to the Windows key values:

Option = Alt

Control = Ctrl

Command = Win = Meta key = Gui

Right Alt = AltGr = Option

Change the value of the Knob Key

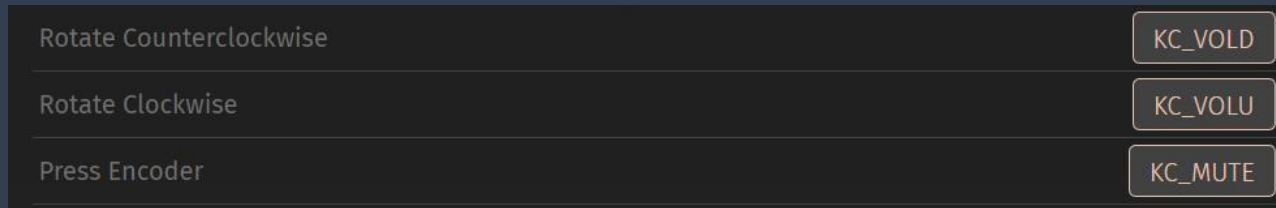

Figure 1

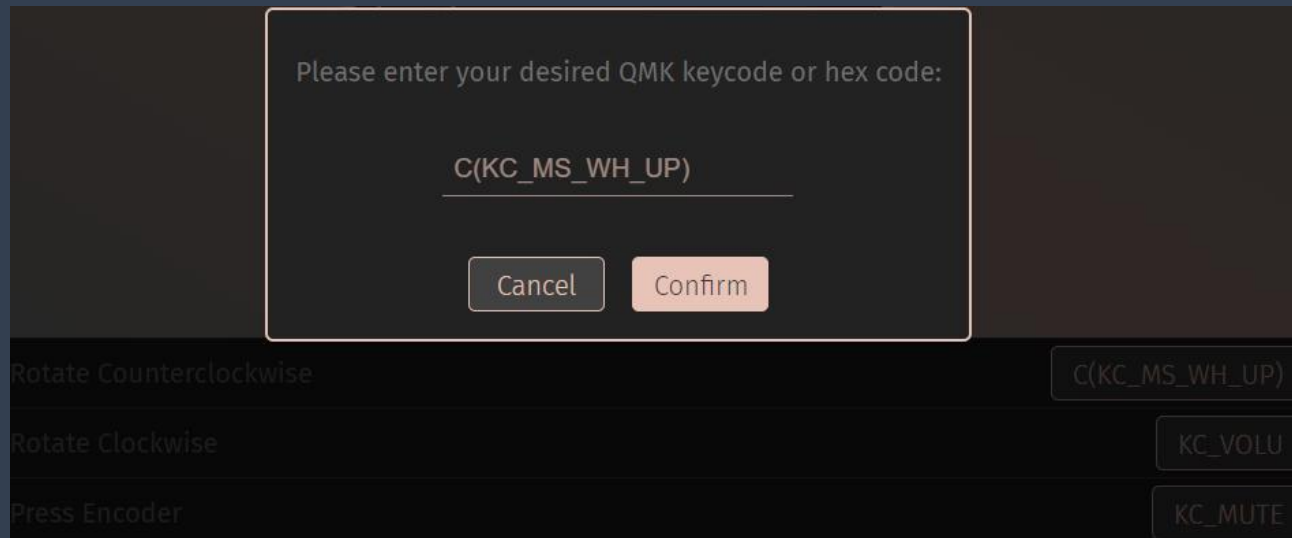

Figure 2

The key value of the knob is changed through the ANY key. After clicking on the corresponding knob, the key value set under the knob is displayed in the function settings zone below (Figure 1). Click on the key value on the right, and the ANY key value will pop up (Figure 2). Just enter and type the corresponding ANY key value in the input box. For example:

The value of the CTRL+ ANYY key on the mouse wheel up

`C(KC_MS_WH_UP)`

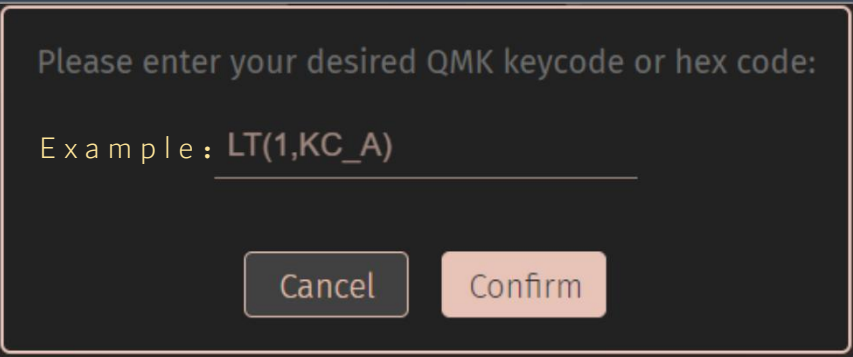

C stands for CTRL;

KC_MS_WH_UP stands for the mouse wheel up

Usage of the ANY Key “LT”

LT is a two-in-one key, hold down to switch to the specified layer, click to another key value

Note that clicking on a key value cannot be a modifier such as CTRL, ALT, GUI, or SHIFT

For example: LT(1,KC_A)

When you hold it down, it switches to layer 1, and when you click it, it's the letter A

If you need to change the key value to a backlight adjustment key, you can use basic remapping to change the key value to a backlight control type key, or you can use the ANY key to change it to one of the following key values:

- SWITCH: RGB_TOG
- COLOR+: RGB_HUI
- Saturation+: RGB_SAI
- Bright+: RGB_VAI
- Speed+: RGB_SPI
- MODE: RGB_RMOD
- COLOR-: RGB_HUD
- Saturation-: RGB_SAD
- Bright-: RGB_VAD
- Speed-: RGB_SPD

Usage of the ANY Key “MT”

MT is a two-in-one key. Holding down is one key value, and clicking is another key value

Note that you can only hold down modifier keys such as CTRL, ALT, GUI, and SHIFT

Modifier	Description
MOD_LCTL	Left Control
MOD_LSFT	Left Shift
MOD_LALT	Left Alt
MOD_LGUI	Left GUI (Windows/Command/Meta key)
MOD_RCTL	Right Control
MOD_RSFT	Right Shift
MOD_RALT	Right Alt (AltGr)
MOD_RGUI	Right GUI (Windows/Command/Meta key)
MOD_HYPR	Hyper (Left Control, Shift, Alt and GUI)
MOD_MEH	Meh (Left Control, Shift, and Alt)

For example:
MT(MOD_LALT,KC_A)
It's ALT when you hold it down, and the letter A when you click:

Letters and Numbers

Key	Description
KC_A	a and A
KC_B	b and B
KC_C	c and C
KC_D	d and D
KC_E	e and E
KC_F	f and F
KC_G	g and G
KC_H	h and H
KC_I	i and I
KC_J	j and J
KC_K	k and K
KC_L	l and L
KC_M	m and M
KC_N	n and N
KC_O	o and O
KC_P	p and P
KC_Q	q and Q
KC_R	r and R

Key	Description
KC_S	s and S
KC_T	t and T
KC_U	u and U
KC_V	v and V
KC_W	w and W
KC_X	x and X
KC_Y	y and Y
KC_Z	z and Z
KC_1	1 and !
KC_2	2 and @
KC_3	3 and #
KC_4	4 and \$
KC_5	5 and %
KC_6	6 and ^
KC_7	7 and &
KC_8	8 and *
KC_9	9 and (
KC_0	0 and)

At the end of the article, please find the reference key value codes for inputting key value commands in macros and ANY key:

F Keys

Key	Description	Key	Description
KC_F1	F1	KC_F13	F13
